The stamper taper is designed to coat the data side of a stamper with protective film. This serves to protect the data side against mechanical stress and damage.

The operation is very simple. A roll of protective film is placed on a roll holder. The film is then threaded between press cylinder and drive cylinder and fed on by operating a crank. Then the stamper is fed through the cylinders with the data side down. Then the crank is operated until the stamper is covered by the film.

The film can be removed easily and will leave no residue.
