Oscar is the cost-efficient addition to the technotrans waste water treatment systems to reduce disposal costs.

The compact system is directly connected to the sludge tank of the waste water unit and concentrates the nickel sludge in special filter bags. oscar has an automatic circulation process, whereby the muddy waste water is continuously pumped in a loop.

The installation is simple, oscar just needs compressed air. Oscar requires almost no maintenance, minimal space and is easy to operate. The volume of sludge produced by the waste water treatment is reduced up to approx. 5% of its volume.

This correspondingly reduces the disposal costs to a fraction of the normal costs. After use the filter bags are removed and disposed of. Naturally oscar can be combined with almost any other waste water treatment system that works by means of sedimentation.
